Lab: Introduction to Unit Testing (Java)

Tasks to do

1. Open a Maven project `lab2_currencyEditor` in IntelliJ.
2. Write a test plan for the method `addMoney()` of the interface `IMoney`. Namely, add a text file into the project and create a list of all required test cases for the given method.
3. Write a class `MoneyBagTest` including method `setUp()` and methods for testing of the following methods of `MoneyBag` class:
   (a) `addMoney()` – 4 tests;
   (b) `contains()` – 4 tests.

   Note: Every test case has to be documented. The documentation includes the following info:

   - what the test case checks;
   - what input data is used in the test case;
   - what is the "expected" result.

   The example of such documentation is below:

```
@Test
//checking functionality: adding the same type of money to the IMoney
// containing only one type of currency
//input data: object Money amount 10, type CHF
//expected result: 24CHF (object Money(24, "CHF")
public final void addMoney_add_10_14_res24() {
    IMoney expected= m24CHF;
    Money bag[] = {new Money(10,"CHF")};
    MoneyBag result = new MoneyBag(bag);

    assertEquals(expected, result.addMoney(new Money(14,"CHF")));
}
```
